# Objectives

The BONDSHIP project is a major European initiative

- to introduce into shipbuilding the use of adhesive bonding for joining lightweight materials.
- The aim is to make European shipyards more competitive by achieving considerable cost savings in the production of passenger ships and high-speed craft (~30% for a small superstructure).
- This will be achieved by
  (a) studying the structural behaviour of bonded joints, including long-term performance in a marine environment,
  (b) designing, building, testing and repairing prototypes involving superstructures of patrol craft, secondary attachments to cruise ship superstructures and load bearing connections in superstructures, and
  (c) preparing guidelines for use of adhesive bonding in such applications.
  The main results are guidelines for the design and modelling of bonded joints; acceptance tests and criteria; inspection methods; documented application cases and joint designs; production and repairs procedures.

# Adhesive Bonding

- Thousands of adhesives are on the market
- The behaviour of an adhesive joint depends on
  - the geometry,
  - the environment,
  - the adhesive,
  - the adherends,
  - the manufacturing process,
    the load case,
  - the loading rate,
  - the manufacturing process,
  - ….

➔ (Class) approval of an adhesive does not help!

➔ How to approach the problem?

# Work Packages and Tasks

Design and Modelling

Testing

Vosper Thornycroft: AC Patrol Vessel

Fincantieri: AC Cruise Ships

Meyer Werft: AC Cruise Ships

| WP1: DESIGN, MODELLING AND TESTING OF JOINTS |
|---|
| 1.1 Modelling of joints |
| 1.2 Testing of joints |
| 1.3 Structural analysis and global strength analysis |
| 1.4 Design of joints |
| **WP2: ACCCEPTANCE AND QUALIFICATION OF JOINTS** |
| 2.1 Specify application cases |
| 2.2 Selection of materials |
| 2.3 Define guidelines and procedures |
| 2.4 Inspection of joints |
| 2.5 Feedback from trials on a ship |
| **WP3: APPLICATION CASE 1** |
| 3.1 Prototype design |
| 3.2 Production of prototype |
| 3.3 Repair trials |
| 3.4 Performance of joints and critical defects |
| **WP4: APPLICATION CASE 2** |
| 4.1 Prototype design |
| 4.2 Production of prototype and testing |
| 4.3 Repair trials |
| **WP:5 APPLICATION CASE 3** |
| 5.1 Prototype design |
| 5.2 Production of prototype and testing |
| 5.3 Repair trials |
| **WP6: PROJECT MANAGEMENT AND EXPLOITATION OF RESULTS** |
| 6.1 Co-ordination of project |
| 6.2 Technical coordination of WP's |
| 6.3 Preparation of exploitation of results |

RAMSSES

# BONDSHIP

BONDSHIP is about the procedure to use adhesive bonding

in shipbuilding and to bond on shipyards

# JLM-AC 6 Doors, …

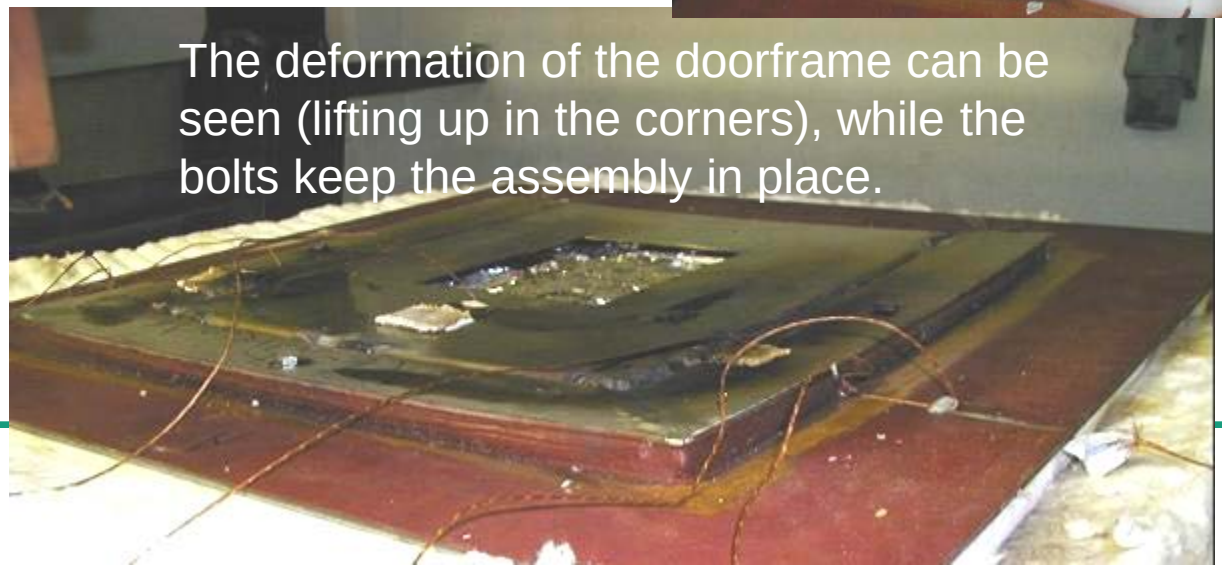
„Small“ door frame for fire testing.

08.2002

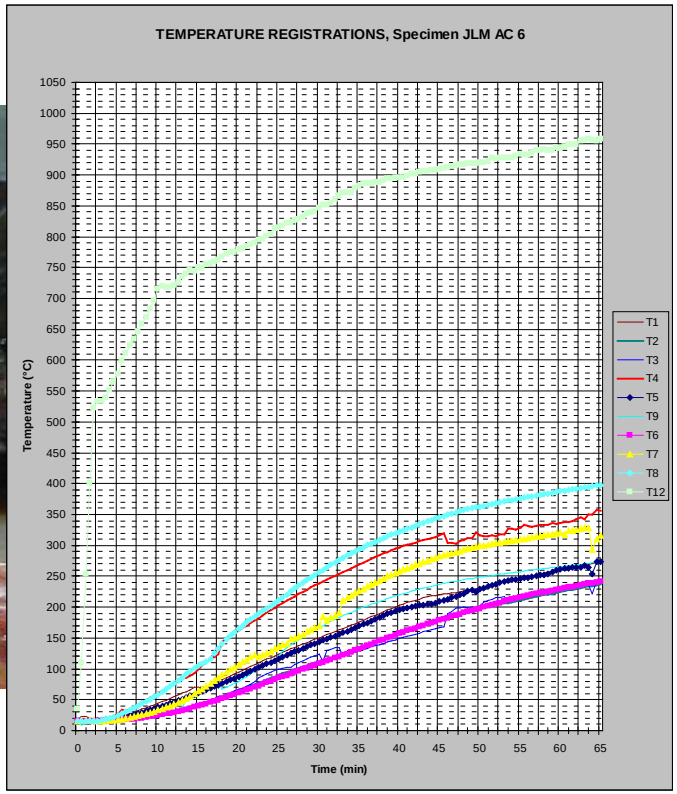
# Fire Testing

Photos showing smoke development during the first 5 to 10 minutes of fire test. From the photo on the right it can be seen that the smoke is not from the adhesive.



The deformation of the doorframe can be seen (lifting up in the corners), while the bolts keep the assembly in place.

# Fire Testing



- The adhesive layer is soft and permanently destroyed.
- The temperature rise on the door blade at 60 min is more than 250°C (T9).
- The temperature on the unexposed side of the door frame is 336-338°C (T4 and T8) at 60 min.
- The temperature in the bondline between bulkhead part and adhesive (T2 and T6) is approx. 225°C at 60 min, while the temperature behind the insulation (T1 and T5) was 260°C at 60 min .

… based on more than 500 pages of test reports … which are still available.

# Lessons learned:

… the main obstacles to apply adhesive bonding are:

- Unused to methods to approach an application
- Long qualification procedures

- Qualification of people on all levels
  ➔ long term behaviour

## Open Question:

- Who is taking the risk if anything goes wrong?

RAMSSES

Fraunhofer IFAM

# Outlook

➔ Open remaining adhesive joints in mock-up – investigate the biotope

➔ Clearify how to use results from BONDSHIP in RAMSSES
